SwissProt\_40:\* Database : Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

"Moldecular clouding of cDNAs encoding a LD78 receptor and putative leukocyte chemotactic peptide receptors.";
Int. Immunol. 5:1239-1249(1993).
-!- FUNCTION: ORPHAN RECEPTOR.
-!- SUBCELULAR LOCATION: Integral membrane protein.
-! SIMILARITY: BELONGS TO FAMILY 1 OF G-PROTEIN COUPLED RECEPTORS.
                                                                                                            Homo sapiens (Human).

PTM: SULFATION PLAYS A CRITICAL ROLE IN THE ASSOCIATION OF C5AR
WITH C5A, BUT NO SIGNIFICANT ROLE IN THE ABILITY OF THE RECEPTOR
TO TRANSDUCE A SIGNAL AND MOBILIZE CALCIUM IN RESPONSE TO A SMALL
PEPTIDE AGONIST (BY SIMILARITY).
SIMILARITY: BELONGS TO FAMILY 1 OF G-PROTEIN COUPLED RECEPTORS.
                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Immunogenetics 44:446-452(1996).
I-munosenetics 44:446-452(1996).
I-reduction: RECEPTOR FOR THE CHEMOTACTIC AND INFLAMMATORY PEPTIDE ANAPHYLATOXIN C5A. THIS RECEPTOR STIMULATES CHEMOTAXIS, GRANULE ENZYME RELEASE AND SUPEROXIDE ANION PRODUCTION.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     InterPro; IPR000276; GPCR_Rhodpsn.

Immunogenetics 44:46-452(1996).
Immunogenetics CHEMOTANIS GRANULE
ANAPHYLATOXIN CSA. THIS RECEPTOR STIMULARES CHEMOTAXIS, GRANULE
ENTYME RECEATION INTEGRAL Membrane protein.
I- PTM: SULPATION PLAYS A CRITICAL ROLE IN THE ABILITY OF THE RECEPTOR
WITH CSA, BUT NO SIGNIFICANT ROLE IN THE ABILITY OF THE RECEPTOR
TO TRANSDUCE A SIGNAL AND MOBILIZE CALCIUM IN RESPONSE TO A SMALL PEPTIDE AGONIST (BY SIMILARITY).
I- SIMILARITY: BELONGS TO FAMILY 1 OF G-PROTEIN COUPLED RECEPTORS.
                                                                                                                                                                            Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Immunogenetics 44:446.452(1996).

-I- FUNCTION: RECEPTOR FOR THE CHEMOTACTIC AND INFLAMMATORY PEPTIDE ANAPHYLATOXIN C5A. THIS RECEPTOR SITMULATES CHEMOTAXIS, GRANULE ENZYME RELEASE AND SUPEROXIDE ANION PRODUCTION.

-I- SUBCELLULAR LOCATION: Integral membrane protein.

-I- PTM: SULFATION PLAYS A CRITICAL ROLE IN THE ASSOCIATION OF C5AR WITH C5A, BUT NO SIGNIFICANT ROLE IN THE ABILITY OF THE RECEPTOR TO TRANSDUCE A SIGNAL AND MOBILIZE CALCIUM IN RESPONSE TO A SMALL PEPTIDE AGONIST (BY SIMILARITY).

-I- SIMILARITY: BELONGS TO FAMILX 1 OF G-PROTEIN COUPLED RECEPTORS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Pfam; PF00001; 7tm_1; 1.

1- FUNCTION: ORPHAN RECEPTOR. COULD BE A CHEMOTACTIC PEPTIDE RECEPTOR. MAY HAVE A FUNCTION IN BONE METABOLISM.

1- SUBCELICULAR LOCATION: Integral membrane protein.

1- TISSUE SPECIFICITY: HIGH EXPRESSION IN HEART AND LUNG, LOW IN SMALL INTEGRINES, COLON, KIDNEY, LIVER, UTERUS, AND BRAIN.

1- SIMILARITY: BELONGS TO FAMILY 1 OF G-PROTEIN COUPLED RECEPTORS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    7 (POTENTIAL).

Biophys. Res. Commun. 233:336-342(1997).
                                                                                                                                                                                                                        "Chemical, a putative chemoattractant receptor, is expressed in moncoyte-derived dendritic cells and macrophages and is a coreceptor for SIV and some primary HIV-1 strains.";

-I- FUNCTION: ORPHAN RECEPTOR. COULD BE A CHEMOTACTIC PEPTIDE
RECEPTOR. MAY HAVE A FUNCTION IN BONE METABOLISM. ACTS AS A CORECEPTOR FOR SEVERAL SIV STRAINS (SIYMAC136, SIVMAC239,
                                                                                                                                                                                                                                                                                                                                             -1- SUBCELLULAR LOCATION: Integral membrane protein.
-1- ALTERNATIVE PRODUCTS: 2 ISOFORMS; A (SHOWN HERE) AND B; ARE PRODUCED BY ALTERNATIVE SPLICING.
-1- TISSUE SPECIFICITY: PROMINENTLY EXPRESSED IN DEVELOPING OSSEOUS AND CARTILAGINOUS TISSUE. ALSO FOUND IN ADDLT PARATHYROLD GLANDS.
-1- DEVELOPMENTAL STAGE: EXPRESSED DURING BONE DEVELOPMENT.
-1- SIMILARITY: BELONGS TO FAMILY 1 OF G-PROTEIN COUPLED RECEPTORS.

J. Biol. Chem. 274:6411-6420(1999).
-- FUNCTION: Involved in oxygen transport from the lung to the various paripheral tissues.
-- SUBUNIT: Heterotetramer of two alpha-D chains and two beta chains. The component D forms dimers of tetramers upon deoxygenation.
-- TISSUE SPECIFICITY: Red blood cells.
-- DEVELOPMENTAL STAGE: In birds, the alpha-D chain occurs in a minor hemoglobin component, called hemoglobin d, which is expressed in hemoglobin component, called hemoglobin d, which is expressed in hate embryonic and adult life.
-- HISCELLANBOUS: REF. 5 CHAIN WAS ISOLATED FROM HBM, THE LEAST ABUNDANT OF THE FOUR EARLY CHICK HEMOGLOBINS.
-- SIMILARITY: BELONGS TO THE GLOBIN FAMILY.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        angiotensin II
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Segar J.L.;

"Differential gene expression and regulation of renal angiotensin I receptor subtypes (AT1 and AT2) during fetal life in sheep.";

Pediatr. Res. 38:896-904(1995).

-!- FUNCTION: RECEPTOR FOR ANGIOTENSIN II. MAY HAVE A ROLE IN CELL MORPHOGENESIS AND RELATED EVENTYS IN GROWTH AND DEVELOPMENT.

-!- SUBCELLULAR LOCATION: Integral membrane protein.
-!- SIMILARITY: BELONGS TO FAMILY 1 OF G-PROTEIN COUPLED RECEPTORS.
FUNCTION: CLATHRIN IS THE MAJOR PROTEIN OF THE POLYHEDRAL COAT
                                                                -i- SUBUNIT: CLATHRIN COATS ARE FORMED FROM MOLECULES CONTAINING 3
HEAVY CHAINS AND 3 LIGHT CHAINS.
-i- SUBCELLULAR LOCATION: CYTOPLASMIC FACE OF COATED PITS AND VESICLES.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Cetartiodactyla; Ruminantia; Pecora; Bovoidea;

Type II iodothyronine delodinase (EC 3.8.1.4) (Type-II 5'deiodinase)
DIOZ OR TXDIZ OR ITDIZ.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  -1- CATALYTIC ACTIVITY: L-thyroxine + AH(2) = 3,5,3'-L-triiodo-L-thyronine + iodide + A + H(+).
-1- COFACTOR: SELENOCYSTEINE. THE ACTIVE-SITE SELENOCYSTEINE IS ENCODED BY THE OPAL CODON, UGA.
-1- TISSUE SPECIFICITY: HIGH LEVELS SEEN IN THE METAMORPHOSING TAIL.
-1- SIMILARITY: BELONGS TO THE IODOTHYRONINE DEIODINASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       IN REGULATING THYROID HORMONE ACTION IN THESE TISSUES. PLAYS A MAJOR ROLE IN DEVELOPMENT.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Rana catesbeiana (Bull frog).

                                                                                                                                                                                                                                                                                                    TIMENOGENETICS 44:446-452(1996).
-I- FUNCTION: HIGH AFFINITY RECEPTOR FOR N-FORMYL-METHIONYL PEPTIDES, WHICH ARE POWERFUL NEUTROPHILS CHEMOTACTIC FACTORS. BINDING OF FMLP TO THE RECEPTOR CAUSES ACTIVATION OF NEUTROPHILS. THIS RESPONSE IS MEDIATED VIA A G-PROTEIN THAT ACTIVATES A PHOSPHATIDYLINGSITOL-CALCIUM SECOND MESSENGER SYSTEM.
-I- SUBGELLULAR LOCATION. Integral membrane protein.

INDUDING HIGH AFFINITY RECEPTOR FOR N-FORMYL-METHIONYL PEPTIDES,
-!- FUNCTION: HIGH AFFINITY RECEPTOR FOR N-FORMYL-METHIONYL PEPTIDES,
-!- FUNCTION: HIGH AFFINITY RECEPTOR CHISCHENDING OF
FMLP TO THE RECEPTOR CAUSES ACTIVATION OF NEUTROPHILS. THIS
RESPONSE IS MEDIATED VIA A G-PROTEIN THATA ACTIVATES A
PHOSPHATIDYLINOSITOL-CALCIUM SECOND MESSENGER SYSTEM.
-!- SUBCELLULAR LOCATION: Integral membrane protein.
-!- SIMILARITY: BELONGS TO FAMILY 1 OF G-PROTEIN COUPLED RECEPTORS.
-!- SIMILARITY: BELONGS TO FAMILY 1 OF G-PROTEIN COUPLED RECEPTORS.

PRICHART OF HER RECEPTOR CAUSES ACTIVATION OF NEUTROPHILS. THIS RESPONSE IS MEDIATED VIA A G-PROTEIN THAT ACTIVATES A PHOSPHATIDYLINOSITOL-CALCIUM SECOND MESSENGER SYSTEM.

I. SUBCELLULAR LOCATION: Integral membrane protein.

I. TISSUE SPECIFICITY: NEUTROPHILS.

I. TISSUE SPECIFICITY: NEUTROPHILS.

I. POLYMORPHISM: THE WARIANT SEQUENCES ARE THOUGHT TO BE DUE TO ALLELIC VARIATION OF A SINGLE GENE.

I. SIMILARITY: BELONGS TO FAMILY 1 OF G-PROTEIN COUPLED RECEPTORS.

"Cloning and differential tissue-specific expression of three mouse beta chemokine receptor-like genes, including the gene for a functional macrophage inflammatory protein-l alpha receptor.";
J. Blol. Chem. 270:17494-17501(1995).
--- FUNCTION: RECEPTOR FOR A C-C TYPE CHEMOKINE. BINDS TO MIP-1-ALPHA, SUBSEQUENTLY TRANDICES A SIGNAL BY INCREASING THE INTRACELULAR CALCIUM INC. LEVEL. RESPONSIBLE FOR AFFECTING STEM CELL.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             -1- SUBCELLULAR LOCATION: Integral membrane protein.
-1- TISSUE SPECIFICITY: DETECTED IN THE HEART, SPLEEN, LUNG,
PERITONEAL EXUDATE CELLS AND LEUKOCYTES.
-1- SIMILARITY: BELONGS TO FAMILY 1 OF G-PROTEIN COUPLED RECEPTORS.
                                                                                                                                                                                                                         Molecular characterization of two murine eosinophil beta chemokine

ITSUE SPECIFICITY: IN ADULT, HIGHLY EXPRESSED IN MYOMETRIUM WITH
LOWER LEVELS IN ADRENLE GLAND AND FALLOPIAN TUBE. VERY HIGHLY
EXPRESSED IN FETAL KIDNEY AND INTESTINE.
SIMILARITY: BELONGS TO FAMILY 1 OF G-PROTEIN COUPLED RECEPTORS.
                                                                                                                                                                                            Chassagne C., Beatty B.G., Meloche S.; "Assignment of the human angiotensin II type 2 receptor gene (AGTR2) to chromosome Xq22-q23 by fluorescence in situ hybridization."; Genomics 25:601-603(1995).

Biophys. Acta 1263:155198(1955).

1. FUNCTION: RECEPTOR FOR ANGIOTENSIN II MAY HAVE A ROLE IN CELL MORPHOGENESIS AND RELAED EVENTS IN GROWTH AND DEVELOPMENT.

1. SUBCELLULAR LOCATION: Integral membrane protein.

1. TISSUE SPECIFICITY: ABUNDANT EXPRESSION IN FETAL TISSUES, IMMATURE BRAIN, SKIN WOUND AND ATRETIC OVARIAN FOLLICLES.

1. DEVELOPMENTAL STAGE: ABUNDANT IN WHOLE FETUS BUT DECREASES RAPIDLY
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AFTER BIRTH. IN ADULTS IS HIGHLY EXPRESSED IN THE ADRENAL, PRESENT IN THE BRAIT AND UTENCE BUT UNDETECTABLE IN THE BRAIT.
